

Dilithium and NTT DoCoMo complete video IoT cases

NTT DoCoMo and Dilithium Networks have developed a series of 3G terminal test cases for advanced video telephony. The interoperability test (IoT) cases will be incorporated into the Dilithium Networks Analyzer.

According to US-based Dilithium, the IoT cases will be used in the development of new 3G handsets and handset software upgrades. They will also be used to ensure that handset users can access video telephony services when roaming away from their home network.

DoCoMo claims the IoT cases “will help provide seamless 3G video telephony globally”.
